Case Study: Autonomous AI B2B Lead Nurturing & Multi-CRM Engine

1. Project Overview

This project showcases a production-ready enterprise solution that automates lead ingestion, performs context-aware generative AI lead qualification, updates multi-CRM structures, and sends personalized customer follow-ups within 5 seconds without manual human intervention.

2. Tech Stack & Integration Ecosystem

Component	Technology Used	Role in Architecture
Workflow Engine	Make.com	Event-driven orchestration loops
AI/LLM Core	OpenRouter (MiniMax Flash)	Context extraction and dynamic lead scoring
Agile DB / CRM	Google Sheets	Raw lead landing and batch management
Enterprise CRM	HubSpot CRM	Centralized contact records for sales teams
Email Services	Google Workspace Gmail	Instant personalized dynamic response routing

3. Operational Pipeline Logic

• **Ingestion:** Triggered instantly via raw row entries populated in Google Sheets.
• **AI Scoring:** The LLM parses user messages and evaluates project financial budgets under strict constraint limits (Threshold: $1000 for Hot Leads vs Warm Leads). Outputs structured dynamic JSON formats.
• **CRM Mapping:** Programmatically injects lead score metrics and syncs contact entities seamlessly into the HubSpot database dashboard.
• **Nurturing Sequence:** Automatically dispatches real-time, contextually tailored plain-text emails via custom SMTP integrations.

4. Core Impact & Key Deliverables

• Achieved a **100% reduction** in manual data-entry time for sales qualification pipelines.
• Boosted lead nurturing deployment speeds from hours to **less than 5 seconds**.
• Successfully processed multiple contact entries (Sajib, Anika Rahman, David Miller) with verified delivery tags inside the live HubSpot Production Portal.
